Polymer Optics and Photonics:

Part 2: Application of polymers in optics

Alexandra Trofimova

General Physics Department, Belarussian State University, Minsk, Belarus

Abstract:

Photosensitive polymer materials undergoing certain changes in their optical properties upon light impact provide key functions of many modern optical devices and technologies. The lectures discuss the direct connection between these photoinduced changes in polymers and their certain optical applications. The polarization optics of polymers is given the most attention, including polarization phase recording and LC-display technologies.
