Research activity:

The research activity is devoted to the study of the structural and dynamical properties of nanostructured materials by spectroscopic approaches such as elastic, quasi-elastic and inelastic scattering, time-resolved fluorescence, non-linear optics, circular and linear dichroism and laser Doppler electrophoresis. Nanostructured materials represent a good model for soft matter physics and chemistry and, if properly functionalized, find interesting applications as sensors at nanoscopic scale and photoactive substrates.

The main research topics concerns: Self-assembly; Supramolecular interactions; Supramolecular chirality; Molecular recognition, Spectroscopic-based applied methodologies.

Publications:

More than 130 papers published on international peer-reviewed ISI journals (H-index 36).
